# From Brittle to Better

## Osteoporosis

**IMA CGP Golden Jubilee Dr. Arulrhaj Oration**  
**07/12/2024**

**Mr Anant Mahapatra MS (Orth), MCh (Orth), FRCS, FRCS(Orth), FIOA, FFSEM<sup>1</sup>**

**Mr Kealan Blake SpR MB BCh BAO, BSc, MSc, MCh, MRCS<sup>1</sup>**

*<sup>1</sup>Trauma and Orthopaedics, Our lady of Lourdes Hospital Drogheda*

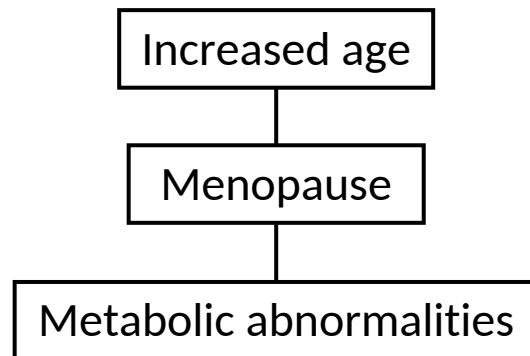

# Introduction

“...a systemic skeletal disease characterized by **low bone mass** and **microarchitectural deterioration** with a consequent increase in bone fragility with susceptibility to fracture...”

WHO definition

Common  
Causes:

# Importance in primary care: Epidemiology

200 million people worldwide

- **Male: female** ratio is **1:4**
  - Men have a higher prevalence of **secondary osteoporosis (60%)** including
    - Hypogonadism, glucocorticoid excess, alcoholism
- Age bracket
  - Osteoporosis
    - **Postmenopausal** osteoporosis is highest in women aged 50-70 years
      - **Senile** osteoporosis begins after 70 years
      - **Secondary** osteoporosis begins at any age
- Fractures
  - **Wrist** fractures most commonly 50-60 years
  - **Vertebral** most commonly 60-70 years
  - **Hip** fractures most commonly 70-80 years

>

>

# Etiology

**Quantitative** (not qualitative) disorder of bone mineralization

**Primary:** Age related, post-menopausal

**Secondary:** Underlying conditions (Endocrine, chronic illness)

Risk factors

**Non-modifiable:** Age, gender, family history, genetics

**Modifiable:** Lifestyle (smoking, alcohol, sedentary behavior), nutritional deficiencies, low BMI

**Medications:** Steroids, anticonvulsants, proton pump inhibitors

**OFTEN ASYMPTOMATIC**

# Changes in cortical bone

## Decreased thickness

- Increase of bone diameter to maintain bending stiffness

CT cross sections of the femur

# Changes in cortical bone

Increased Haversian canal areas (lacunae formation)

- Increased weakness and predisposition to low-energy fractures

## Decreased thickness

- Less “working length” of implants

# Test results in an osteopenic bone model

loading....stiffness...failure...example...

5 days later

10 months postoperatively

# Signs of poor bone quality

- Multiple vertebral compression fractures
- Previous hip, radial, or tibial plateau fractures
- End-stage renal disease
- Steroid or anticonvulsant therapy

# Diagnosis: Imaging

## DEXA Scan (Dual Energy Xray Absorptiometry)

Performed in

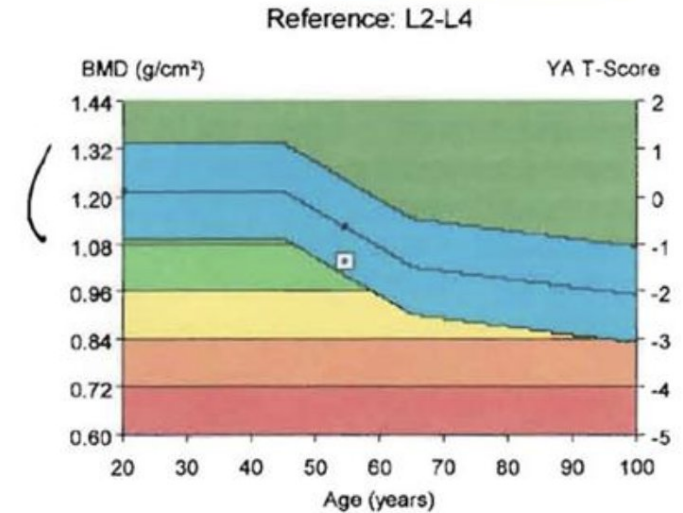

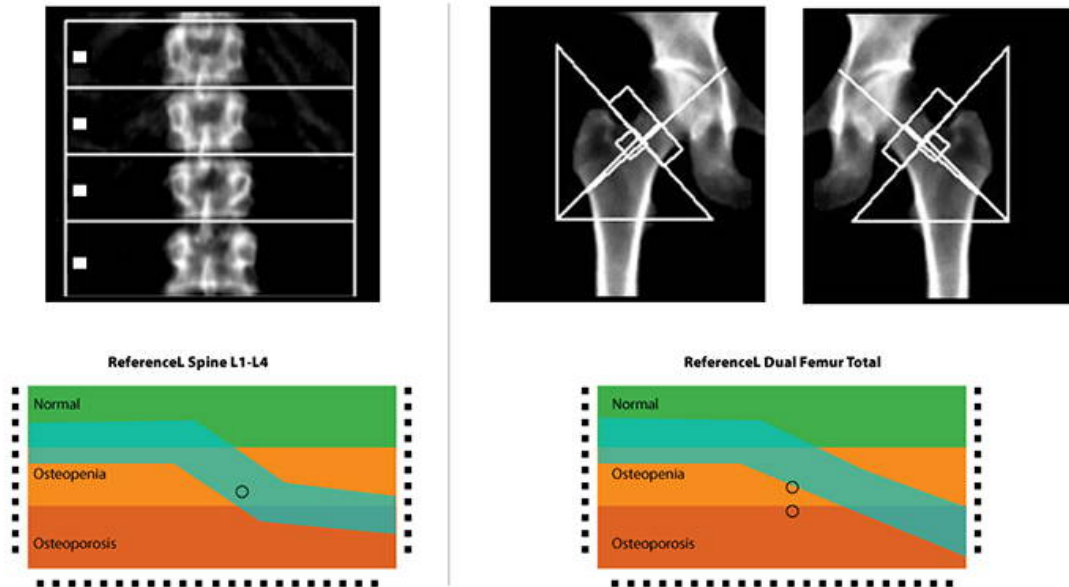

- **Lumbar spine:** measures BMD from L2 to L4 and compiles scores
- **Hip:** measure BMD from femoral neck, trochanter, and intertrochanter region and compiles scores

Sensitivity and specificity

- most accurate with the least amount of radiation exposure

### T-Score

**Osteopenia:** -1 to -2.5 standard deviations  
**Osteoporosis:** >-2.5 standard deviations

Region	<sup>1</sup> BMD (g/cm <sup>3</sup> )	<sup>2</sup> Young-Adult T-Score	<sup>3</sup> Age-Matched Z-Score
L2-L4	1.037	-1.4	-0.7

## Changes in **cortical** and **cancellous** bone

# Diagnosis: Lab studies

- **25-hydroxyvitamin D** level
- Other labs may be drawn to rule out other causes of osteoporosis (endocrine, hematologic, malignancy, etc)
- Complete blood count (CBC), calcium, phosphate, alkaline phosphatase

## Special Tests to Rule Out Secondary causes

- Thyroid function tests, **vitamin D** levels, parathyroid hormone (**PTH**)
- Serum protein electrophoresis (**SPEP**) for multiple myeloma
- Other endocrine and metabolic markers as indicated

### Histology

- Thinned trabeculae
- Decreased osteon size
- Enlarged Haversian and marrow spaces
- Osteoclast ruffled border

# Screening + Risk Assessment

Women  $\geq 65$  years and men  $\geq 70$  years

## Who Should be Screened?

Postmenopausal women  $< 65$  years with additional risk factors

Patients with a history of fractures or on long-term corticosteroids

## Risk Assessment Tools

**FRAX** (Fracture Risk Assessment Tool): **10-year probability of fracture**  
Recommendations for incorporating BMD into risk calculation

# Choice of Antiosteoporotic Treatment

- the level of fracture risk,
- additional clinical risk factors,
- cost-effectiveness of treatment,
- resemblance of the patient's characteristics to the populations of effectiveness studies of antiosteoporotic medicines
- patient preferences

## When to refer to Osteoporosis Specialist

- A recent vertebral fracture [within the last 2 years]
- $\geq 2$  vertebral fractures [whenever they have occurred]
- BMD T-Score  $\leq -3.5$
- Treatment with high dose glucocorticoids [ $\geq 7.5$  mg/day of prednisolone or equivalent over 3 months] (refer urgently given rapid loss in bone post initiation of glucocorticoids; if any delay is anticipated, start an oral bisphosphonate in the meantime)
- The presence of multiple clinical risk factors, particularly with a recent fragility fracture indicating high imminent risk of re-fracture,
- Or other indicators of very high fracture risk.

# Management: Lifestyle + non-pharmacological treatment

## Dietary Recommendations

**Calcium** and **vitamin D** intake, role of other nutrients (e.g., magnesium, vitamin K)

## Exercise and Physical Activity

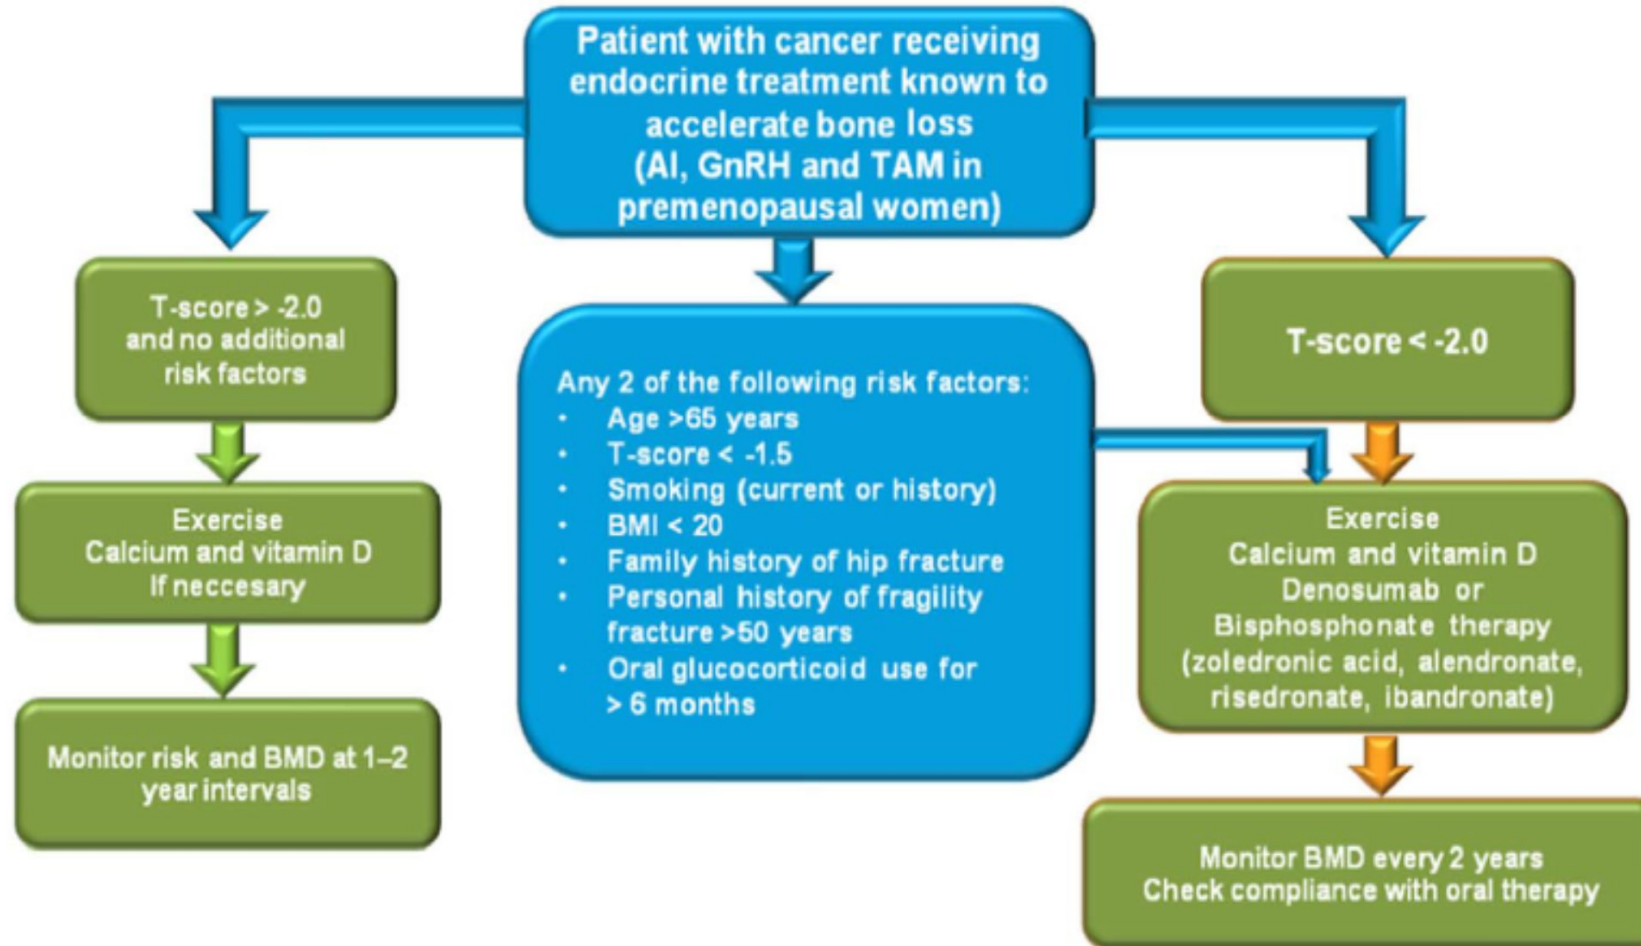

Activity **Weight-bearing** and muscle-strengthening exercises

## Lifestyle Modifications

Smoking cessation, alcohol moderation, **fall prevention strategies** (fracture liaison services)

# Cancer Induced Osteoporosis

# Osteoporosis patterns in Hip fracture patients

- A: normal bone formation and slightly increased bone resorption.
- B and C: secondary hyperPTH and increased bone turnover, related to CKD and hypovitaminosis D
- C: as B with worse e-GFR and very high bone turnover

**E. Papakitsou et al. Hormones 2021. Bone metabolism subgroups identified as hip fracture patients via clustering**

# Management: Pharmacological treatment

## First-Line Therapies

**Bisphosphonates:** Alendronate, risedronate, zoledronic acid

## Alternative Options

**Denosumab:** Mechanism and administration  
Selective Estrogen Receptor Modulators (SERMs):  
Raloxifene

## Anabolic Agents

**Teriparatide,** romosozumab for severe osteoporosis or high fracture risk

Monitoring and follow up

# Prevention strategies

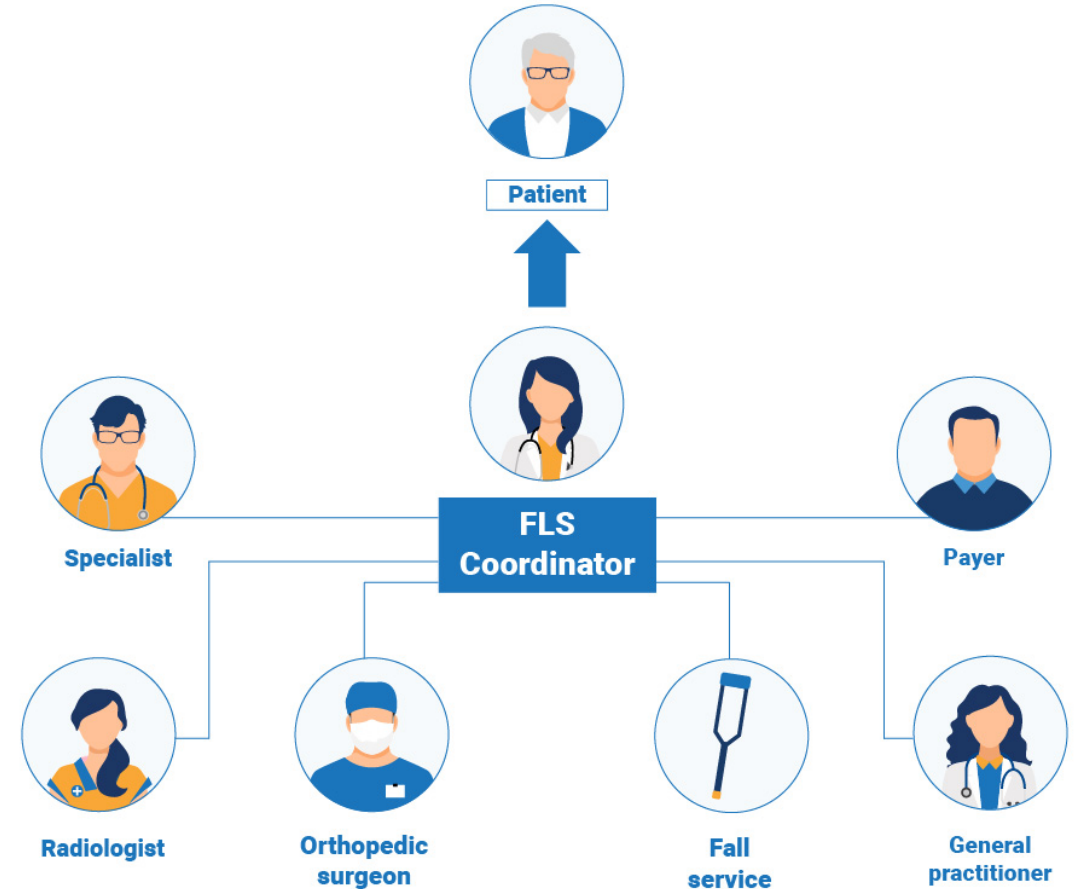

## **Primary Prevention** in At-Risk Populations

Educating patients on diet, exercise, and lifestyle

## **Secondary Prevention** Post-Fracture

Early rehabilitation, fall prevention in elderly

**Role of multidisciplinary team** for fracture liaison services (FLS)

# Denosumab discontinuation

Fig. 3. Effects of stopping denosumab on bone turnover.

Reprint form Tsourdi et al Bone

Reprint from Anastasilakis et al.

**CMAJ 2018 23;190(16). Warning of an increased risk of vertebral fracture after stopping denosumab**

# Key take away points

Importance of **early diagnosis** and **regular screening**

**Comprehensive treatment** combining **lifestyle**, **exercise** and **pharmacotherapy**

**Role of GP's** in **patient education** and **follow-up**
